Thanks for the update.

When you said you are pulling together the other information I requested, did you mean the PCB data?

Hi Chris,

I thought I was going to have to transmit to you through the box website but after I pdf'd the document it was small enough to email. We may use the box again in the future, but I'll setup a different invite for that. Long story short, you don't need to accept the invite.

I'm busily pulling together the other information you requested.

The excavation of the area south of Building C was completed late last week. Initial sampling results indicated a total of four confirmation samples had concentrations of PCE exceeding the IAO. Two of these were located adjacent to the water line and could not be further excavated. The other two were from sidewall samples collected from the 15' excavation (south and east walls at 12.5 ft bgs.) The concentrations in these two samples were around 200 ppb for PCE. Additional excavation of these sidewalls has been performed and we are awaiting the follow on confirmation results.

Also last week the drums and contents were moved from the plastic sheeting into a roll off box for disposal at Kimball.

Stockpiled soil is being trucked off site for disposal at Lone Mt. This activity will continue through the week and possibly into next week.

Thanks,

Mike Stephenson

I received an invitation from Cameron-Cole to collaborate on a box. Does that invite contain the same information as this email or do I still need to accept the invite?

Also, were there any PCBs detected in the soft white material?

Thanks.

Hello Chris,

Attached please find two documents. One provides photos and a narrative describing the drum discoveries at the CH Wichita facility and the other provides the analytical data for detected

compounds from drum sampling conducted in your presence on March 11, 2015. Please call me if you have any questions about this.

Thanks,
